PREVIEW	17
A treatise on the differentials and integrals	17
Retrospection of IDD	20
To the attention of researchers studying the method proposed	30
CHAPTER 1. REVIEW ON EXISTING METHODS WITH CONCOMITANT ANALYSIS AND CONCLUSIONS IN THE VEIN OF IDD. GOAL AND TASKS OF THIS THESIS	31
1.1. Introductory notions, terms and symbols. Kinds of loading	31
1.2. Fatigue life under cyclic uniaxial or multiaxial proportional loading. $S-N$ line	40
1.2.1. General notes	40
1.2.2. Influence of a static (mean) stress	45
1.2.3. About the $S-N$ line under multiaxial state of stress	48
1.2.4. Composing an $S-N$ line	52
1.3. Fatigue life under non-cyclic uniaxial or multiaxial proportional loading	54
1.3.1. Cycle counting (schematization). Miner rule. Amplitude spectrum	54
1.3.2. Cycle counting methods. Rain-flow method	56
1.3.3. Is it possible not to divide the loading into cycles and count them?	60
1.3.4. "History", "future", continuity, static level	61
1.3.5. Linear and non-linear damage accumulation	63
1.4. Fatigue life under multiaxial non-proportional loading	66
1.4.1. Reduction (decomposition) of the loading	66
1.4.2. Reduction to an equivalent stress	68
1.4.3. The concept of a critical plane and corresponding methods	69
1.4.4. Integral methods over the planes	74
1.4.5. Non-proportional $\sigma(t) \equiv \sigma_x(t)$ and $\tau(t) \equiv \tau_{xy}(t)$	76
1.4.6. Rotating bending with steady torsion	78
1.4.7. Non-proportional $\sigma_x(t)$ and $\sigma_y(t)$	81
1.5. Conclusions from the Review	82
1.6. The goal and tasks of this thesis	84
CHAPTER 2. IDD THEORY	87
2.1. Loading (stressing) differential	87
2.1.1. Stress differentials $d\sigma_x$, $d\sigma_y$ and $d\tau_{xy}$	87
2.1.2. Invariant loading differential ($d\sigma'$, $d\sigma''$, $d\tau$)	88
2.1.3. Geometrical form of the invariant loading differential d_s	92
2.1.4. Components of the loading differential. Basic IDD types of loading. Resolution of the loading differential	97
2.2. Basic damage differentials and basic damage intensities	101
2.3. Determination of $R \equiv R_r$ and application of IDD to one value of k	105
2.3.1. Determination of $R(s)$ based on the Newton-Leibniz formula	105
2.3.2. The function $R(s)$ and $D(s)$ containing i^* divisor	108
2.3.3. $S-N$, $S-R$ and $S-D$ lines. 'Breaking' (impulse) mode and 'smooth' mode	110

2.3.4.	Numerical examples. Equation of 'bending' (smooth) $S-N$ line	112
2.3.5.	The opportunity for fatigue life computation without cycle counting, in impulse 'peak' and 'range' mode, and in smooth mode	114
2.3.6.	An example for the values of the i^* divisor with $s_m \neq 0$ and for the possibility to directly set $i^* = 2$	118
2.3.7.	Approximation of true damage intensity by the introduced symmetrical averaging intensity	120
2.4.	Determination of R_r in the whole $\sigma'-\sigma''$ plane. Concomitant issues	122
2.4.1.	Introducing lines of equal lives	122
2.4.2.	Taking static stresses (or R stress ratios) into consideration.....	123
2.4.3.	Symmetry towards the η axis	127
2.4.4.	Exchanging the values of the principal stresses (switching over the signs $\pm$). First, second and third condition	129
2.4.5.	Central symmetry and symmetry towards the ξ axis	133
2.4.6.	Composition of the lines of equal lives	134
2.4.7.	Determination of $N(s \equiv s_{\max})$ and $R_r(s)$ at any k	136
2.4.8.	Initial description of procedures in the <i>Ellipse</i> algorithm	138
2.5.	The R_c damage intensity in the whole $\sigma'-\sigma''$ plane. Concomitant issues	139
2.5.1.	Possible pure c -loading and determination of the basic R_c	139
2.5.2.	Introducing R_c -prototypes compared to R_r -prototypes	144
2.6.	The R_τ damage intensity in the whole $\sigma'-\sigma''$ plane. Concomitant issues	147
2.6.1.	The pure $d\tau$ -loading. The rotating disk of Findley et al.	147
2.6.2.	Stress analysis and another proposal for technical implementation of the pure $d\tau$ -loading	151
2.6.3.	Possibility of determination of the basic R_τ	155
2.6.4.	Introducing R_τ -prototypes compared to the R_r -prototypes	158
2.6.5.	The pure $d\tau$ -loading as maximized case and other cases of 'weaker' loading	159
2.6.6.	Comparative fatigue life assessments in the cases considered (not in favor of the critical plane concept)	163
2.7.	The damage differential dD in the general case of combined loading. Versions of the IDD method	164
2.7.1.	Searching for an empirical formula for dD	164
2.7.2.	The first version (using $\mathcal{E}$, $\mathcal{E}'$ and a single R -intensity)	165
2.7.3.	The generalization using three damage intensities	166
2.7.4.	Other more (simplified) versions. Additional notes	168
2.7.5.	IDD equation with the R_r -intensity and the factors f_c and f_τ . First and second practical category of non-proportional loadings.....	171
2.7.6.	Approximating the true damage intensity	174
2.7.7.	No-damage areas and lines that surround them	174
2.8.	IDD in statistical (probabilistic) interpretation under random loading	178
2.8.1.	Two-dimensional density of instantaneous values and computing the fatigue life based on it	178
2.8.2.	One-dimensional interpretation under random r -loading	184
2.9.	Interpolation for IDD	185
2.9.1.	The necessity of interpolation. A number for interpolation	185

2.9.2. Trigonometric interpolation	187
2.9.3. Cubic-spline interpolation	189
2.10. Conclusions	191
CHAPTER 3. SOFTWARE AND VERIFICATIONS OF IDD UNDER A SINGLE OSCILLOGRAM	193
3.1. The <i>Integral</i> algorithm	193
3.1.1. An oscillogram as an example	193
3.1.2. Algorithmic IDD equation of the fatigue life.....	194
3.1.3. The <i>Integral</i> computer program. Demos	195
3.2. Comparison with CCA (Cycle Counting Approach)	198
3.2.1. Preliminary analysis	198
3.2.2. Comparison to the rain-flow method under the same oscillogram	200
3.2.3. The smooth <i>S-N</i> line and its <i>R</i> prototype	205
3.2.4. Examples under a non-zero static level and comparison	207
3.3. Real tests and comparison (under zero static level)	212
3.3.1. Experimental oscillograms and <i>S-N</i> line	212
3.3.2. Experimental and computed lives	215
3.4. Conclusions	220
CHAPTER 4. THE <i>ELLIPSE</i> SOFTWARE	221
4.1. The more important mathematical and algorithmic details	221
4.1.1. Intensities and input oscillograms involved, and a 'Code'	221
4.1.2. The transformation of the variant elements into invariant ones	223
4.1.3. The angular third switchover condition and determination of the $\alpha'(t)$ function	227
4.1.4. Radial third switchover condition and concomitant dividing variant elements into two sub-elements. Continuity or discontinuity over the η axis	236
4.1.5. Solution of the problem of dividing into two sub-elements.....	241
4.1.6. Elements Δs_r close to <i>O</i> . The current point falling into the <i>L</i> area. About the impulse mode	244
4.1.7. Details about the current elliptic equation	246
4.1.8. Analysis on the possibility to obtain and solve the current elliptic equation	248
4.1.9. Solving the current elliptic equation and computing the damage intensity.....	252
4.1.10. The graph mode	254
4.2. The <i>EllipseT</i> program	258
4.2.1. Demo of entering the leading data	259
4.2.2. Demo of entering the current data and obtaining the life	262
4.2.3. Demo of the graph mode, etc.	266
4.2.4. The trigonometric polynomial. Demos regarding the influence of n_i	268
4.2.5. Demos of disconnected and connected Δs_{xy} elements, $\Delta \tau$ -loading, etc.	270
4.3. The cubic-spline interpolation. The program <i>EllipseS</i> (and <i>EllipseC</i>)	273
4.3.1. Some mathematical and algorithmic details	273
4.3.2. Demos with <i>EllipseS</i> (similar to sections 4.2.1 – 4.2.3)	275

4.3.3. Demos with <i>EllipseS</i> (similar to Section 4.2.5)	276
4.3.4. The <i>EllipseC</i> program	277
4.4. Conclusions	278
CHAPTER 5. IDD VERIFICATIONS UNDER NON-PROPORTIONAL LOADINGS OF THE FIRST PRACTICAL CATEGORY	279
5.1. Strategy of the verifications	279
5.2. Initial Adaptation (0) for determination of the IDD parameters (using data of Timshin and Hazanov)	280
5.2.1. Experimental data	280
5.2.2. Adaptation according to the simplified IDD version with a single R -intensity	283
5.2.3. Adaptation according to the main IDD version with the three intensities	285
5.3. Verification (1) (using data of Neugebauer)	289
5.3.1. Experimental data	289
5.3.2. Computing the IDD lives under the non-proportional loadings	291
5.3.3. Additional and conclusive notes	292
5.4. Verification (2) (using data of Simbürger)	294
5.4.1. Experimental data	294
5.4.2. Composing the input files	296
5.4.3. Verification results and conclusions	297
5.4.4. A check of influence of systematic error	298
5.5. Verification (3) (using data of Atzori et al.)	300
5.5.1. Experimental data and input prototypes	300
5.5.2. The data under combined 90^0 -out-of-phase loading	301
5.5.3. Computation of the lives and conclusions	302
5.6. Verification (4) (using data of Störzel et al.)	303
5.6.1. Laserbeam welded tube-tube specimens and local stresses in them	303
5.6.2. Experimental data for input prototypes	305
5.6.3. 90^0 -out-of-phase experimental and computed lives	307
5.6.4. 45^0 -out-of-phase experimental and computed lives	310
5.6.5. Conclusions after Verification (4)	311
5.7. Verification (5) (using data of Sonsino)	312
5.7.1. Experimental data and composing the R_r -prototypes	312
5.7.2. Computation of 'in-phase' lives	314
5.7.3. 90^0 -out-of-phase experimental and computed lives, and conclusions	315
5.8. Verification (6) (using data of Stoychev)	317
5.8.1. Experimental data under rotating bending with constant torsion	317
5.8.2. Forming the L-files and C-files	318
5.8.3. Graph mode illustration and additional considerations	321
5.8.4. Computed lives. Conclusions	322
5.9. Conclusions from Chapter 5	323
5.9.1. IDD N_{cmp} - N_{exp} diagram	323
5.9.2. Empirical data bank of the IDD parameters and conclusions	324
CHAPTER 6. NECESSITY AND POSSIBILITY FOR APPLICATION OF IDD TO MACHINES AND TECHNICAL EQUIPMENT IN THE FOREST INDUSTRY	327

6.1. Registration of this thesis to only one accredited scientific speciality	327
6.2. First example [33]	328
6.2.1. Circular shaft. Kinematics of cutting	328
6.2.2. Cutting forces on the teeth	331
6.2.3. Approximate expectations of the normal and sheer stress oscillograms	332
6.2.4. Conclusion	336
6.3. Second example	336
6.3.1. Band-saw blade	336
6.3.2. Calculation scheme	338
6.3.3. Expectations of the tensile stress oscillogram. Conclusion	339
CONCLUSION	341
